

Characterised control valve with sensor-operated flow rate or power control, power and energy-monitoring function, 2-way, Internal thread, PN 25 (Energy Valve)

- Nominal voltage AC/DC 24 V
- Control modulating, communicative, hybrid, Cloud
- For closed cold and warm water systems
- For modulating control of air-handling and heating systems on the water side
- Ethernet 10/100 Mbit/s, TCP/IP, integrated web server
- Communication via BACnet, Modbus, Belimo MP-Bus or conventional control
- optional Belimo Cloud connection
- Glycol monitoring

Type overview

Type	DN []	Rp ["]	V'nom [l/s]	V'nom [l/min]	kvs theor. [m³/h]	PN []
EV015R+BAC1	15	1/2	0.35	21	2.9	25
EV020R+BAC1	20	3/4	0.65	39	4.9	25

kvs theor.: Theoretical kvs value for pressure drop calculation

Technical data

Electrical data	Nominal voltage	AC/DC 24 V
	Nominal voltage frequency	50/60 Hz
	Nominal voltage range	AC 19.2...28.8 V / DC 21.6...28.8 V
	Power consumption in operation	4 W (DN 15...25) 5 W (DN 32...50)
	Power consumption in rest position	3.7 W (DN 15...25) 3.9 W (DN 32...50)
	Power consumption for wire sizing	6.5 VA (DN 15...25) 7.5 VA (DN 32...50)
	Connection supply / control	Cable 1 m, 6 x 0.75 mm²
	Connection control Ethernet	RJ45 socket
	Parallel operation	Yes (note the performance data)
Functional data	Torque motor	5Nm (DN 15...25) 10Nm (DN 32...40) 20Nm (DN 50)
	Communicative control	BACnet IP, BACnet MS/TP Modbus TCP, Modbus RTU MP-Bus Cloud
	Operating range Y	2...10 V
	Input Impedance	100 kΩ
	Operating range Y variable	0.5...10 V
	Position feedback U	2...10 V
	Position feedback U note	Max. 1 mA
	Position feedback U variable	0...10 V 0.5...10 V
	Sound power level Motor	35 dB(A) (DN 15...40) 45 dB(A) (DN 50)
	Adjustable flow rate V'max	30...100% of Vnom
	Control accuracy	±5% (of 25...100% Vnom) @ 20°C / Glycol 0% vol.

Technical data

Functional data	Control accuracy note	±10% (of 25...100% V'nom)	
	Parametrisation	via integrated web server / ZTH EU	
	Fluid	Cold and warm water, water with glycol up to max. 50% vol.	
	Fluid temperature	-10...120°C	
	Permissible operating pressure ps	1600 kPa	
	Close-off pressure Δps	1400 kPa	
	Differential pressure Δpmax	350 kPa	
	Differential pressure note	200 kPa for low-noise operation	
	Flow characteristic	equal percentage (VDI/VDE 2178), optimised in the opening range (switchable to linear)	
	Leakage rate	air-bubble tight, leakage rate A (EN 12266-1)	
	Pipe connectors	Internal thread according to ISO 7-1	
	Installation position	upright to horizontal (in relation to the stem)	
	Servicing	maintenance-free	
	Manual override	with push-button, can be locked	
Flow measurement	Measuring principle	Ultrasonic volumetric flow measurement	
	Measuring accuracy flow	±2% (of 25...100% Vnom) @ 20°C / Glycol 0% vol.	
	Measuring accuracy flow note	±6% (of 25...100% V'nom)	
	Min. flow measurement	1% of V'nom	
Temperature measurement	Measuring accuracy absolute temperature	± 0.6°C @ 60°C (Pt1000 EN60751 Class B)	
	Measuring accuracy temperature difference	±0.23 K @ ΔT = 20 K	
	Resolution	0.05°C	
Glycolmonitoring	Measurement display glycol	0...40% or >40%	
Safety	Protection class IEC/EN	III Protective extra-low voltage (PELV)	
	Degree of protection IEC/EN	IP40	
	Degree of protection note	IP54 when using protective cap or protective grommet for RJ45 socket	
	EMC	CE according to 2014/30/EU	
	Mode of operation	Type 1	
	Rated impulse voltage supply / control	0.8 kV	
	Control pollution degree	3	
	Ambient temperature	-30...50°C	
	Storage temperature	-40...80°C	
	Ambient humidity	Max. 95% r.H., non-condensing	
	Materials	Flow measuring pipe	Brass body nickel-plated
		Closing element	Stainless steel
		Stem seal	EPDM O-ring
		Immersion sleeve	Brass
	T-Piece	Nickel-plated brass body	

Safety notes

- This device has been designed for use in stationary heating, ventilation and air-conditioning systems and must not be used outside the specified field of application, especially in aircraft or in any other airborne means of transport.
- Outdoor application: only possible in case that no (sea) water, snow, ice, insolation or aggressive gases interfere directly with the actuator and that is ensured that the ambient conditions remain at any time within the thresholds according to the data sheet.
- Only authorised specialists may carry out installation. All applicable legal or institutional installation regulations must be complied during installation.
- The device contains electrical and electronic components and must not be disposed of as household refuse. All locally valid regulations and requirements must be observed.

Product features

Mode of operation The HVAC performance device is comprised of four components: characterised control valve (CCV), measuring pipe with volumetric flow sensor, temperature sensors and the actuator itself. The adjusted maximum flow (\dot{V}'_{\max}) is assigned to the maximum positioning signal (typically 10 V / 100%). Alternatively, the positioning signal can be assigned to the valve opening angle or to the power required on the heat exchanger (see power control). The HVAC performance device can be controlled communicative or analogue. The fluid is detected by the sensor in the measuring pipe and is applied as the flow value. The measured value is balanced with the setpoint. The actuator corrects the deviation by changing the valve position. The angle of rotation α varies according to the differential pressure through the final controlling element (see flow rate curves).

Flow characteristic

Flow rate curves

Transmission behaviour HE

Heat exchanger transmission behaviour

Depending on the construction, temperature spread, fluid characteristics and hydraulic circuit, the power Q is not proportional to the water volumetric flow \dot{V} (Curve 1). With the classical type of temperature control, an attempt is made to maintain the control signal Y proportional to the power Q (Curve 2). This is achieved by means of an equal-percentage valve characteristic curve (Curve 3).

Power control

Alternatively, the positioning signal Y can be assigned to the output power required on the heat exchanger.

Depending on the water temperature and air conditions, the Energy Valve ensures the amount of water required to achieve the desired power.

Maximum controllable power on heat exchanger in power control mode:

DN 15	80 kW
DN 20	140 kW
DN 25	250 kW
DN 32	380 kW
DN 40	530 kW
DN 50	1010 kW

Control characteristics

The specially configured control parameters in connection with the precise velocity sensor ensure a stable quality of control. They are, however, not suitable for rapid control processes, i.e. for domestic water control.

Product features

Definition Flow control
 \dot{V}'_{nom} is the maximum possible flow.

\dot{V}'_{max} is the maximum flow rate which has been set with the greatest positioning signal. \dot{V}'_{max} can be set between 30% and 100% of \dot{V}'_{nom} .

\dot{V}'_{min} 0% (non-variable).

Definition Power control
 Q'_{nom} is the maximum possible power output on the heat exchanger.

Q'_{max} is the maximum power output on the heat exchanger which has been set with the greatest positioning signal. Q'_{max} can be set between 1% and 100% of Q'_{nom} .

Q'_{min} 0% (non-variable).

Product features

Creep flow suppression Given the very low flow speed in the opening point, this can no longer be measured by the sensor within the required tolerance. This range is overridden electronically.

Opening valve

The valve remains closed until the volumetric flow required by the positioning signal Y corresponds to 1% of V'_{nom} . The control along the valve characteristic curve is active after this value has been exceeded.

Closing valve

The control along the valve characteristic curve is active up to the required flow rate of 1% of V'_{nom} . Once the level falls below this value, the flow rate is maintained at 1% of V'_{nom} . If the level falls below the flow rate of 0.5% of V'_{nom} required by the reference variable Y , then the valve will close.

Communication The parametrisation can be carried out through the integrated web server (RJ45 connection to the web browser) or by communicative means. Additional information regarding the integrated web server can be found in the separate documentation.

“Peer to Peer” connection

Positioning signal inversion

This can be inverted in cases of control with an analogue positioning signal. The inversion causes the reversal of the standard behaviour, i.e. at a positioning signal of 0%, regulation is to V'_{max} or Q'_{max} , and the valve is closed at a positioning signal of 100%.

Hydraulic balancing

Via the integrated web server, the maximum flow rate (equivalent to 100% requirement) can be adjusted on the device itself, simply and reliably, in a few steps. If the device is integrated in the management system, then the balancing can be handled directly by the management system.

Product features

Delta-T manager

If a heating or cooling register is operated with a differential temperature that is too low and thus with a flow rate that is too high, this will not result in an increased power output.

Nevertheless, heating or cooling machines must provide the energy at a lower degree of efficiency. This means, that pumps circulate too much water and increase energy consumption unnecessarily.

With the aid of the Energy Valve, it is simple to discover that operation is being carried out at a differential temperature that is too low, resulting in the inefficient use of energy. Necessary setting adjustments can now be carried out quickly and easily at any time. The integrated differential temperature limiting offers the user the possibility of defining a low limit value. The Energy Valve limits the flow rate automatically to prevent the level from falling below this value.

The settings of the Delta-T manager can be made either directly on the web server or via the Belimo Cloud a direct analysis of the Delta-T behavior is carried out by Belimo experts.

Power output of the heating or cooling registers 1
Diff. temperature between supply and return 2
Loss zone (heating or cooling register saturation) 3
Adjustable minimum differential temperature 4

Combination analogue - communicative (hybrid mode)

With conventional control by means of an analogue positioning signal, the integrated web server, BACnet, Modbus or MP-Bus can be used for the communicative position feedback.

Power and energy monitoring function

The final controlling device is equipped with two temperature sensors. A sensor (T2) must be installed at the valve and the second sensor (T1) must be installed on-site on the other side of the water circulation. The two sensors are enclosed with the system already wired. The sensors are used to record the fluid temperature of the supply and return lines of the consumer (heating/cooling coil). As the water quantity is also known, thanks to the volumetric flow measurement integrated in the system, the power released from the consumer can be calculated. Furthermore, the heating/cooling energy is also determined automatically by means of the evaluation of the power over time.

The current data, e.g. temperatures, volumetric flow volumes, exchanger energy consumption etc. can be recorded and accessed at any time by means of web browsers or communication.

Data recording

The recorded data (integrated data recording for 13 months) can be used for the optimisation of the overall system and for the determination of the performance of the consumer.

Download csv files through web browser.

Belimo Cloud

Additional Services are available, if the Energy Valve is connected to the Belimo Cloud: for instance, several devices may be managed via Internet. Also Belimo experts may help analyse the delta-T behavior or provide written reports about the Energy Valve performance. Under certain conditions, the product warranty according to the applicable Terms and Conditions of Sale may be prolonged. Further details may be found under [www.belimo.com/ext-warranty]

Glycol monitoring

Glycol monitoring measures the actual glycol content, which is necessary for safe operation and optimised heat exchange.

Manual override

Manual override with push-button possible (the gear is disengaged for as long as the button is pressed or remains locked).

High functional reliability

The actuator is overload protected, requires no limit switches and automatically stops when the end stop is reached.

Accessories

	Description	Type
Electrical accessories	Grommet for RJ connection module	Z-STRJ.1
	Connection cable 5 m, A: RJ11 6/4 ZTH EU, B: 6-pin service socket for Belimo device	ZK1-GEN
Mechanical accessories		Type
	Pipe connector for ball valve DN 15 Rp 1/2"	ZR2315
	Pipe connector for ball valve DN 20 Rp 3/4"	ZR2320
	Pipe connector for ball valve DN 25 Rp 1"	ZR2325
	Pipe connector for ball valve DN 32 Rp 1 1/4"	ZR2332
	Pipe connector for ball valve DN 40 Rp 1 1/2"	ZR2340
	Pipe connector for ball valve DN 50 Rp 2"	ZR2350
Service Tools		Type
	Service Tool, with ZIP-USB function	ZTH EU

Electrical installation

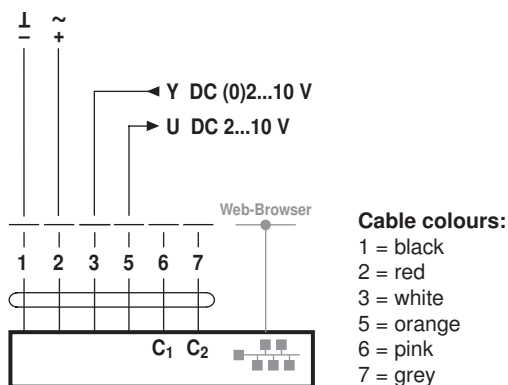

Notes

- Connection via safety isolating transformer.
- Parallel connection of other actuators possible. Observe the performance data.
- The wiring of the line for BACnet MS/TP / Modbus RTU is to be carried out in accordance with applicable RS485 regulations.
- Modbus / BACnet: Supply and communication are not galvanically isolated. Connect earth signal of the devices with one another.

Wiring diagrams

Conventional operation

Web-Browser

Connection of a notebook for parameterisation and manual control via RJ45.

Optional connection via RJ45 (direct connection Notebook / connection via Intranet or Internet) for access to the integrated web server

MP-Bus, supply via 3-wire connection

Electrical installation

MP-Bus via 2-wire connection, local power supply

A) Additional actuators and sensors
(max. 8)

MP-Bus Network topology

There are no restrictions for the network topology (star, ring, tree or mixed forms are permitted). Supply and communication in one and the same 3-wire cable

- no shielding or twisting necessary
- no terminating resistors required

Functions

Functions for devices with specific parameters (Parametrisation necessary)

BACnet MS/TP / Modbus RTU

BACnet IP / Modbus TCP

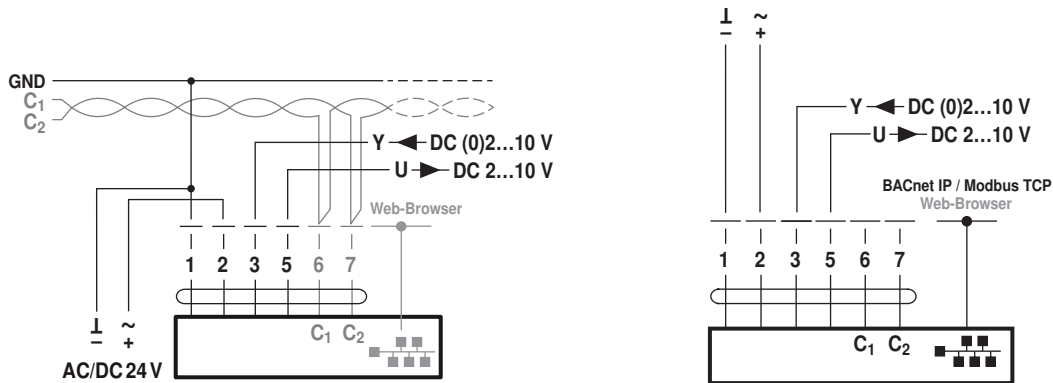

MP-Bus with analog setpoint (hybrid mode)

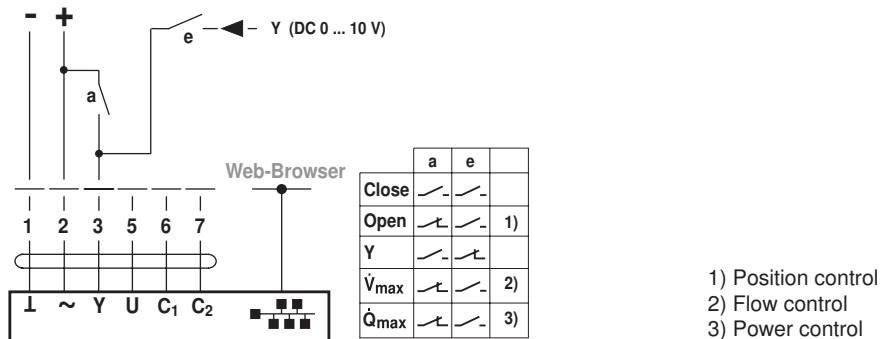

Functions

BACnet MS/TP / Modbus RTU with analog setpoint (hybrid mode) BACnet IP / Modbus TCP with analog setpoint (hybrid mode)

Override control and limiting with DC 24 V with relay contacts (with conventional control or hybrid mode)

Operating controls and indicators

2 LED display green

Off: No power supply or wiring errors
On: In operation
Flickering: Internal communication (Valve/Sensor)

3 Push-button and LED display yellow

On: Adaptation process active
Press button: Triggers angle of rotation adaptation, followed by standard mode

4 Gear disengagement button

Press button: Gear disengages, motor stops, manual override possible
Release button: Gear engages, synchronisation starts, followed by standard mode

5 Service plug

For connecting the ZTH EU

Installation notes

Recommended installation positions The ball valve can be installed upright to horizontal. The ball valve may not be installed in a hanging position, i.e. with the stem pointing downwards.

Mounting position in the return Installation in the return is recommended.

Water quality requirements The water quality requirements specified in VDI 2035 must be adhered to. Belimo valves are regulating devices. For the valves to function correctly in the long term, they must be kept free from particle debris (e.g. welding beads during installation work). The installation of a suitable strainer is recommended.

Servicing Ball valves, rotary actuators and sensors are maintenance-free. Before any service work on the final controlling device is carried out, it is essential to isolate the rotary actuator from the power supply (by unplugging the electrical cable if necessary). Any pumps in the part of the piping system concerned must also be switched off and the appropriate slide valves closed (allow all components to cool down first if necessary and always reduce the system pressure to ambient pressure level). The system must not be returned to service until the ball valve and the rotary actuator have been correctly reassembled in accordance with the instructions and the pipeline has been refilled by professionally trained personnel.

Flow direction The direction of flow, specified by an arrow on the housing, is to be complied with, since otherwise the flow rate will be measured incorrectly.

Inlet section In order to achieve the specified measuring accuracy, a flow-calming section or inflow section in the direction of the flow is to be provided upstream from the flow sensor. Its dimensions should be at least 5x DN.

Installation notes

Installation of immersion sleeve and temperature sensor

The valve is equipped with two fully-wired temperature sensors.

- T2: This sensor is installed on site near the valve unit.
- T1: This sensor is installed on site ahead of the consumer (valve in the return line) or after the consumer (valve in the supply line).

Two T-pieces for installation of the temperature sensors in the pipelines are included in the shipment.

Note

The cables between valve unit and temperature sensors may not be either shortened or lengthened.

General notes

Valve selection

The valve is determined using the maximum required flow rate V'_{\max} .

A calculation of the kvs value is not required.

$V'_{\max} = 30 \dots 100\%$ of V'_{nom}

If no hydraulic data are available, then the same valve DN can be selected as the heat exchanger nominal diameter.

Minimum differential pressure (pressure drop)

The minimum required differential pressure (pressure drop through the valve) for achieving the desired volumetric flow V'_{\max} can be calculated with the aid of the theoretical kvs value (see type overview) and the below-mentioned formula. The calculated value is dependent on the required maximum volumetric flow V'_{\max} . Higher differential pressures are compensated for automatically by the valve.

Formula

$$\Delta p_{\min} = 100 \times \left(\frac{\dot{V}_{\max}}{k_{vs \text{ theor.}}} \right)^2$$

Δp_{\min} : kPa \dot{V}_{\max} : m ³ /h $k_{vs \text{ theor.}}$: m ³ /h
--

Example (DN25 with the desired maximum flow rate = 50% \dot{V}_{nom})

EV025R+BAC

$k_{vs \text{ theor.}} = 8.6 \text{ m}^3/\text{h}$

$\dot{V}_{\text{nom}} = 69 \text{ l/min}$

$50\% \times 69 \text{ l/min} = 34.5 \text{ l/min} = 2.07 \text{ m}^3/\text{h}$

$$\Delta p_{\min} = 100 \times \left(\frac{\dot{V}_{\max}}{k_{vs \text{ theor.}}} \right)^2 = 100 \times \left(\frac{2.07 \text{ m}^3/\text{h}}{8.6 \text{ m}^3/\text{h}} \right)^2 = 6 \text{ kPa}$$

General notes

Behaviour with sensor failure

In case of a flow sensor error, the Energy Valve will switch from either power or flow control to position control (Delta-T manager will be deactivated).

Once the error disappears, the Energy Valve will switch back to the normal control setting (Delta-T manager activated)
